Run Kuku Promo Builder

https://github.com/aditya-samal/Kuku-Promo-Builder

Before you start

Install Git, Python 3.12 or newer, and Node.js 20.19+ or 22.12+ with npm. Have a Gemini API key ready. The commands below are for macOS or Linux.

1. Clone the repo and build the frontend

```
git clone https://github.com/aditya-samal/Kuku-Promo-Builder.git
cd Kuku-Promo-Builder/implementation/frontend
npm ci
npm run build
```

2. Set up the backend

```
cd ../backend
python3 -m venv .venv
.venv/bin/python -m pip install -r requirements.txt
cp .env.example .env
```

Open .env and set LLM_API_KEY to your Gemini API key.

3. Start the app

```
.venv/bin/python run_studio.py
```

Open http://127.0.0.1:8000 in your browser. Upload a ZIP of numbered episode scripts and keep the terminal open while the app processes them.
